

Booking Widget

Kigo Booking Widget Includes:

- Installation of Kigo Booking Widget on your existing website
- Designated PM to assist by email in initial setup, configurations, progress and review

What We Will Need From You:

- Admin access to your site
- Access to your web server (via shell or FTP)
- Specific Location for widget
- Desired Search Fields
- Backup of your website*

Widget Details

- Predefined search fields
- Ability to change width and height sizes
- Max height size: 1500px with all options enabled (not recommended)
- Matching widget style to your brand and website color scheme in the booking widget (script version)
- Search results and bookings will be done in a Kigo site

Terms: Using Kigo Booking Widget (KBW) requires that the Client (You) have a Kigo Core Application (Plan 1-6). The KBW can be installed independently by You or with assistance from the Kigo Professional Services Team (Us/We). If you choose to use the Kigo Professional Services Team the cost is \$495. We will install the KBW on your site, match the color and style of the area it will be placed in. This service does require Admin access to Your site's Content Management System and/or access to your Web Server (via shell or FTP). Please note that we only accept HTML based websites. It is Your responsibility to create a backup of the website prior to Us doing any work on the site. Site backups are essential because problems could occur and We need to be in a position to revert to Your current design, should it be needed.

We will make all reasonable efforts to blend the Kigo Booking Widget with your existing website look, but you may find ourselves unable to fit the KBW exactly to your specification, due to limited available space etc. In those cases an alternative layout will have to be determined.

While we will match the colors and header/footer of the search, detail and booking pages of the KBW, this is not a complete custom website design. If You prefer, please order our Custom Website service instead.

*We recommend doing a website backup before starting the widget installation. This backup needs to be done by the Client.
